

### **Hobsonia**

Sporodochia pinkish or crimson. On Phyiscia tenella group. .... H. christiansenii

## **Homostegia**

Stromata superficial. Ascospores dark brown, ellipsoid-oval, hardly constricted at the septa. On Dermatocarpon. British Columbia. .... H. dermatocarpae Alstrup & M. Cole

### **H. dermatocarpae**

Parasymbiotic, gall-inducing. Stromata up to 1.5 mm in diameter, superficial, black, rugose. Ascomata immersed in the stroma, up to 200 µm in diameter. Asci 48-55 x 15-18 µm, thick-walled, with apical beak, 8-spored, I- with Lugol. Hamathecium of branched and anastomosing elements, 2 µm wide, hymenial gel I+ blue. Ascospores 22-25 x 6-8 µm, 3-septate, hardly constricted at septa, dark brown, ellipsoid-oval, not curved, lower end narrower than upper, ends rounded, with thin halo.

Alstrup, V. and M. S. Cole. 1998. Lichenicolous fungi of British Columbia. *The Bryologist* 101: 221-229.
