

**Usnea: Additional Species from North America**

[U. aculeata Mot. nom. nud.]

[U. affinis Mot. nom. nud.]

Mexico [not reported for U.S. and Canada?check Herre] .....

U. concinna Stirton

U. distincta = U. glabrescens according to Egan

Branches generally terete. "Papillae" usually distinctly elevated before white shows through the cortex, developing into delicate, fragile ramuli at irregular intervals on long branches emerging just above base of thallus; lateral branches short; apothecial cilia short, thin, often sparse; cortical cell lumina ca. 1.54 um, mostly sinuous or rounded in outline. CMA 50100:200325:125200. Thallus bluegray green, remaining gray green. Base of thallus not black (any darkening disappears with growth); "papillae" having predominantly sloping sides. Medulla or axis yellow? [implied by the name].

Eastern. .... **U. endochrysea Stirt.** (U. florida group or U. strigosa group)

U. flagellata = U. filipendula according to Egan

U. rugulosa = U. scabrata according to Egan

U. variegata

3 additional unnamed species from Florida reported by Harris (1990)
